SKILLS

SMART CONTRACTS
Solidity, ERC-20, ERC-721,
ERC-1155, proxy patterns,
diamond pattern (EIP-2535),
upgradeable contracts

DEFI
AMM, FPM, staking,
vesting, multisig,
gas optimization

TOOLS
Hardhat, Foundry (fuzz,
coverage), Ethers.js

CHAINS
Ethereum, Arbitrum,
Optimism, Base

INDEXING
Subsquid, custom
event processing

SECURITY
Pre-audits, reentrancy,
access control, gas
optimization

BACKEND
Go (echo, gRPC,
goroutines, channels),
Python (asyncio,
FastAPI, SQLAlchemy)

DATABASES
PostgreSQL, MongoDB,
MySQL, Redis

INFRASTRUCTURE
Docker, docker-compose,
CI/CD, Git, Linux,
Helm, ArgoCD

EDUCATION

BSTU "VOENMEKH"
St. Petersburg
Computer Science
2020 — 2023

ABOUT

Solidity / EVM developer with 3+ years of production experience in DeFi and fintech. Deployed 20+ smart contracts to mainnet (Ethereum, Arbitrum, Optimism, Base) using proxy and diamond patterns. Built custom FPM prediction markets, staking protocols, and incentives modules. Pre-audit experience. Strong backend in Go and Python — full-cycle from architecture to production.

EXPERIENCE — 3+ YEARS

Smart Contract / Backend Engineer

09.2024 — present

Nox Labs · Remote

- Solidity · Hardhat · Foundry · Go · gRPC · PostgreSQL · Redis · RabbitMQ · Docker · Subsquid
- Deployed 20+ Solidity contracts to mainnet: custom FPM prediction markets (Gnosis-based) with custom Vault, Router with backend-driven logic, share management, multisig controls, whitelist and platform token.
 - Built staking protocol contracts for Terahash (external client): whitelist, platform token, using diamond pattern (EIP-2535); nearly all contracts deployed via proxy (upgradeable) patterns.
 - Contributed to Pholend (Aave V2 fork): developed custom incentives control module for protocol-specific reward distribution.
 - Built a liquidator bot (Python) for Pholend: monitoring health factors across positions, automated on-chain liquidation execution.
 - Built a sybil bot finder (Python): analyzed on-chain transaction patterns (frequency, wallet clusters, fund flows) to detect airdrop-farming accounts with a suspicion scoring system.
 - Developed ERC-20 contracts with vesting schedules; experience with ERC-721 and ERC-1155 token standards.
 - Conducted pre-audits: gas optimization, reentrancy checks, access control validation, business logic review.
 - Built real-time on-chain event processing across EVM chains (Ethereum, Arbitrum, Optimism, Base) with nonce management, gas estimation and Subsquid indexing.
 - Developed backend architecture: 10+ Go microservices (Clean Architecture), gRPC, RabbitMQ, external API integrations with rate limiting and retry strategies.

Backend Engineer

05.2022 — 09.2024

Unistory · Remote

- Python · FastAPI · SQLAlchemy · Go · PostgreSQL · MySQL · Redis · RabbitMQ · Docker · Helm · ArgoCD
Product team, ~20 developers, full-time.
- Developed and maintained backend for xAssets — a decentralized exchange: Python (FastAPI, SQLAlchemy, asyncio), REST APIs, external integrations via OAuth and webhooks, wrote Helm charts for ArgoCD.
 - Optimized PostgreSQL/MySQL queries through query plan analysis, composite indexes and JOIN rewrites; reduced hot endpoint latency via Redis caching.
 - Designed async inter-service messaging via RabbitMQ, reducing coupling and enabling independent deployments.
 - Built background workers with retry logic and DLQ for long-running data processing pipelines.
 - Standardized Docker containerization and CI/CD templates: health-checks, structured logging, graceful degradation.
